I looked through my notes from our meeting with the Drug Lab on 5/2. My understanding from our meeting was that the old Dell PC that Peter would like to replace needs to run on 95 to support the software they run on this PC. Cam was looking into upgrading the software. All DPH IT replacement PCs come with Windows XP. At the very least, Windows 2000. Running XP and 2000 is the Commonwealth's Standard.

Even if you worked something out to purchase the PC, you would still have the PC come with XP. Peter would need to reinstall Windows 95 and the software he used on it.

You need to check and see if Peter needs to run 95 for the software he uses.

Thanks...Dina

Is there any way to help Peter out here besides leasing a computer?

Hi Julie,

In the event you have some extra money or could pull some strings with Dina, I could really use a new computer to replace that stand alone Dell (Windows 95 from the last century) of ours to store and burn data. We're pushing through so many samples now the hard drive (2 gigs) is filling up very fast. If I don't remove old data after the first week of the new month the hard drive fills up and will not accept additional backups. I may be able to compress the data but that seems to be making a simple task more difficult than it has to be.

Thanks,  
Peter
